Chymosin can be produced in a plant seed through introduction of a chimeric nucleic acid molecule, comprising a nucleic acid sequence encoding a chymosin polypeptide operatively linked to transcription regulator and terminator sequences, into a plant cell. The sequences are useful for producing plant seeds, in particular seeds of soybean, rape seed, sunflower, cotton, corn, tobacco, alfalfa, wheat, barley, oats, sorghum, Arabidopsis thaliana, potato, flax/linseed, safflower, oil palm, groundnut, Brazil nut, coconut, castor, coriander, squash, jojoba and rice.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            Producing chymosin in seeds of plants such as rice, flax, rape transforming plant cell with a nucleic acid encoding chymosin linked to transcription regulator and terminator sequences - \frac{1}{2}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (SEMB-)

Chymosin can be produced in a plant seed through introduction of a chimeric nucleic acid molecule, comprising a nucleic acid sequence encoding a chymosin polypeptide operatively linked to transcription regulator and terminator sequences, into a plant cell. The sequences are useful for producing plant seeds, in particular seeds of soybean, rape seed, sunflower, cotton, corn, tobacco, alfalfa, wheat, barley, oats, sorghum, Arabidopsis thaliana, potato, flax/linseed, safflower, oil pal groundnut, Brazil nut, coconut, castor, coriander, squash, jojoba and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAN40295
                                                                                                                                                                                      Also claimed is E.coli JM83/pLC7 (ATCC 39325) which is transformed with pLC7 contg. the prorennin derived sequence fused in phase with B-galactosidase. The pLC7 prorennin expression plasmid includes sequences which code for both the pseudorennin and mature rennin cleavage sites between AAs 28-29 and AAs 42-43, respectively.
                                                                                                                                                                                                                                                                                                                                                                                                                                    mat_peptide

                                                                                                                                                                                                                                                                                 specific clones were used to screen for recombinant plasmids. Only two clones 5G3 and 15C5 were found to contain the whole prorennin sequence with clone 5G5 having its complete coding sequence (shown here). The sequence was the same as the published sequence except for two silent mutations in codons 274 and 336 respectively, and a single mutation in codon 302 which converts the sequence to the B form of rennin. The product of prorennin, rennin is an active component of rennet which is used to clot milk in the process of making cheese.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             11-MAY-1984;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          It was used as heterologous peptide/protein together with parts of the alpha-S1-casein gene in the prodn. of DNA constructs. The heterologous peptide or protein may also be human insulin-like growth factor I. The constructs provide high yields of the protein with simple recovery from the milk. Activation of the gene occurs only in the constructs.
